F2 – Task and Data Plan

First name

- Purpose:
  - The field is used to associate data with a specific user because the fictional survey is to be filled out one time per month over the course of three months. The form only asks for a first name to keep some privacy for the user.
- Required:
  - Yes
  - It needs to be required to keep track of each of the user's submissions
- Control type:
  - text
  - The input type is text because a name field only needs a general text entry.
- Submitted name:
  - name
  - Value is name to associate it with the label text and autocomplete category.
- Autocomplete:
  - name
  - Autocomplete value is name to autofill in the user's stored name if they wish.
- Constraint:
  - There are no constraints for this category because a person's legal name can include any number of symbols or even numerical digits. Having no constraints also allows the user to use an alias of any kind if they prefer not to use a real name.
- Sensitivity:
  - Personal information
    - Privacy improved by reducing to just first name
  - No additional controls for sensitivity used.

Email address

- Purpose:
    - This field is also used to associate a user with their submitted data. Additionally used to notify the user for a form submission each month during their 3-month survey window.
- Required:
    - Yes.
    - It is required to keep track of each of the user's submissions and notify them each month during their survey window.
- Control type:
    - email
    - The input type of email is used to constrain the input information to the email format of "text + @ + text".
- Submitted name:
    - email
    - Named email to keep it consistent with its input type and autocomplete category.
- Autocomplete:
    - email
    - Autocomplete is a value of email to autofill the field with the user's stored email address if the wish.
- Constraint:
    - Constraints only from the input type of email with no additional constraints added.
- Sensitivity:
    - Personal information
    - No additional controls for sensitivity used.

Zip code

- Purpose:
    - To group the user's data into larger regional data to identify trends in water usage.
- Required:
    - Yes.
    - Required because it helps to organize data for analysis.
- Control type:
    - text

    - The input type of text was chosen over and input of number so that the incremental dial would not be within the entry field. Constraints were given to only allow numerical entry.
- Submitted name:
    - zip
    - The name of “zip” was chosen as a shortened version of “zip code”.
- Autocomplete:
    - postal-code
    - Autocomplete value is postal-code to allow the user to autofill the field with their stored zip code.
- Constraint:
    - pattern=“[0-9]*”
        - This constraint only accepts numerical integers from 0 to 9.
    - minlength=“5”
        - The entry must be 5 characters at minimum to conform to the five-digit zip code standard, i.e. 85020.
    - maxlength=“5”
        - The entry cannot be longer than 5 characters so that it conforms to the five-digit zip code standard, i.e. 85020. A full zip code like 12345-6789 is not necessary.
- Sensitivity:
    - Personal information
        - Zip code only utilizes the standard 5-digit structure. Full zip code structure is not used to preserve privacy.
    - No additional controls for sensitivity used.

City / Town

- Purpose:
    - To sort the user’s data into a larger data group organized by city or town to identify trends in water usage.
- Required:
    - Yes.
    - Required because it helps to organize data for analysis.
- Control type:
    - text
    - The input type of text is used so that the user can freely input alpha characters and symbols. There is a constraint that added that blocks numerical values.

- Submitted name:
    - city
    - A name of “city” was chosen as a shortened version of “city / town” that can still identify the input data.
- Autocomplete:
    - address-level2
    - Autocomplete value is address-level2 because this is the form category that stores the city value for forms. The user can use this to autofill their city or town if they wish.
- Constraint:
    - pattern="[^0-9]*"
        - This makes the input field allow all characters except numerical characters from 0 to 9.
        - This constraint was added because cities or towns can have a variety or alpha, symbol, or special characters in their name but any instance of a number in a name is always spelled out with alpha characters rather than numerical ones.
- Sensitivity:
    - Personal information
    - No additional controls for sensitivity used.

Number of people in household

- Purpose:
    - This field allows the user to input the number of people in their household to help show correlations between high and low water consumption and how many people live at a given residence.
- Required:
    - No.
    - Although this information could be helpful in assessing reasons for water consumption (a secondary survey goal), it is not required because the survey is more interested in the water use by area rather than who is using it.
- Control type:
    - number
    - The input type is set to number because a numerical value in numerical characters is easier to read and reference than one spelled out in alpha characters.
- Submitted name:
    - people

    - The name “people” is given as a shortened version of the label name that can still accurately describe the input.
- Autocomplete:
    - No autocomplete was used for this input because it is a generic numerical entry field.
- Constraint:
    - min=“1”
        - A minimum value of 1 is declared because at least one person (the user) would be living at the household if they are filling out the form.
    - max= “20”
        - A max input value of 20 was chosen because this seemed like a generous but still believable value for larger-scale residences.
- Sensitivity:
    - Personal information
        - Full addresses are not asked for which retains privacy on determining household based on number of occupants.
        - Field is also not required which allows the user to omit the information if they choose.
    - No additional controls for sensitivity used.

Average water usage per month in gallons

- Purpose:
    - This field is used to collect the user’s average water use per month for comparative analysis with the rest of the population.
- Required:
    - Yes.
    - Since the survey is interested in water usage, an amount of water used per month is necessary.
- Control type:
    - number
    - The input type is set to number because a numerical value in numerical characters is easier to read and reference than one spelled out in alpha characters.
- Submitted name:
    - usage
    - The name “usage” is given as a shortened version of the label name that can still accurately describe the input.
- Autocomplete:

    - No autocomplete was used for this input because it is a generic numerical entry field.
- Constraint:
    - min="0"
        - A minimum boundary of 0 was declared so that no negative values are input into the field.
    - max="50000"
        - Using information from https://codelibrary.amlegal.com/codes/williams/latest/williams_az/0-0-0-1295, typical usage of a single-family household is between 15,000 and 20,000 gallons. A max value of 50,000 was declared as a generous upper boundary based on this information.
- Sensitivity:
    - Nonidentifiable information.
    - No additional controls for sensitivity used.

Irrigation

- Purpose:
    - To identify if potentially high-water usage is associated with irrigation systems.
- Required:
    - No.
    - While this information would be helpful to identify causes of high-water usage (a secondary goal), the main goal of the survey is to identify water usage quantities per area.
- Control type:
    - radio
    - The question for this input is only interested in a Boolean answer of yes or no. An input type of radio was chosen since radio inputs only allow a selection of one item from a list to be selected at a time.
- Submitted name:
    - irrigation
    - The name "irrigation" is given because it is the same as the legend's name for the fieldset and can accurately describe the input.
    - A value of "Yes" and "No" are given to the respective answers of yes and no.
- Autocomplete:
    - No autocomplete was used for this input but a checked rule was given to the "No" radio input.

- Constraint:
    - No constraints given beyond a checked value for “No” radio input.
- Sensitivity:
    - No identifiable information
    - No additional controls for sensitivity used.

Water Saving Units

- Purpose:
    - To identify if any water saving units contribute to the minimizing water usage.
- Required:
    - No.
    - While this information would be helpful to identify correlations in water usage (a secondary goal of this survey), the main goal of the survey is to identify water usage quantities per area.
- Control type:
    - checkbox
    - An input type of checkbox was chosen so that the user can select multiple options from a list of known water saving units, rather than requiring the user to provide a list in a text entry field.
- Submitted name:
    - water-units
    - A name of “water-units” was chosen as a shortened version of the legend name that could still be associated with the input.
- Autocomplete:
    - Autocomplete was not used.
- Constraint:
    - No constraints used.
- Sensitivity:
    - No identifiable information
    - No additional controls for sensitivity used.

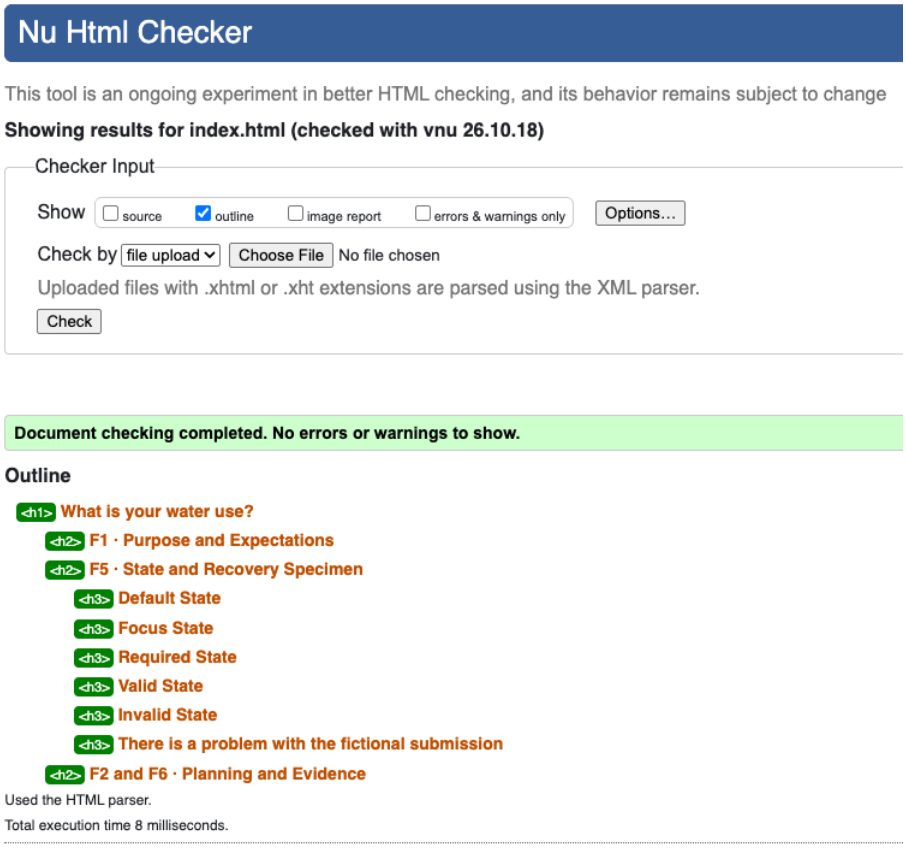

Comments

- Purpose:
    - To allow the user to input any other information they would like form creators to know about.
- Required:
    - No.

    - This section is not required because it is provided as an option to include additional information.
- Control type:
    - textarea
    - The control of textarea was chosen because it allows the user to input long-form text information.
- Submitted name:
    - comments
    - A name of “comments” was chosen because it is the same as the label name and describes the input information.
- Autocomplete:
    - Autocomplete was not used.
- Constraint:
    - No constraints used.
- Sensitivity:
    - Potential for personal information
        - Description asks users to avoid entering personally identifiable information, but it may still occur.
    - No additional controls for sensitivity used.

CSS validation

W3C CSS Validator results for styles.css (CSS level 3 + SVG)

Congratulations! No Error Found.

This document validates as CSS level 3 + SVG !

To show your readers that you've taken the care to create an interoperable Web page, you may display this icon on any page that validates. Here is the XHTML you could use to add this icon to your Web page:

```
<p>
    <a href="https://jigsaw.w3.org/css-validator/check/referer">
        <img style="border:0;width:88px;height:31px"
            src="https://jigsaw.w3.org/css-validator/images/vcss"
            alt="Valid CSS!" />
    </a>
</p>
```

```
<p>
    <a href="https://jigsaw.w3.org/css-validator/check/referer">
        <img style="border:0;width:88px;height:31px"
            src="https://jigsaw.w3.org/css-validator/images/vcss-blue"
            alt="Valid CSS!" />
    </a>
</p>
```

(close the img tag with > instead of /> if using HTML <= 4.01)

What is your water use?

This is a short 2 to 5-minute survey for household water use in the Phoenix Metropolitan Area. We are collecting data from the local population to determine reasons for high consumption, find areas for improvement, and help educate communities on water conservation. Data is collected over the course of three months (quarterly), and we kindly ask for your participation during the three-month period to help us identify usage trends. Findings will be published in our quarterly reports.

F1 • Purpose and Expectations

All fields marked with a * are required.

Your information is collected only for the purpose of this survey, will not be used to identify you personally, and will not be shared outside our organization. Data used in reports is generalized to submissions per area and does not include personal information.

Please see our section below for specific instructions on how to complete the email, zip code, city/town, and average water usage fields. Errors

F3 · Contact information

This information is necessary so we can notify you each month during your participation window, and identify and group your data from each submission.

Code Defense

When validating the index.html with the Nu HTML Checker at validator.w3.org, the validation returned errors for a repeated id of “error-message” for the paragraphs in my error example fields. I updated each of these ids to be unique with “email-error-message”, “zip-error-message”, “city-error-message”, and “usage-error-message”. After this change I validated the index.html file with Nu HTML Checker again and the validator returned no errors.
